A Biological Theory of Law: Natural Law Theory Revisited Hendrik Gommer

Our brain is a fractal structure that can grow thanks to some genes that contain a code, a formula that generates this structure. The basis of evolutionary sociology is that our brain will prompt behavior that is to the benefit of the spreading of our genes. Although people are unaware of it, they generally behave in ways that optimize the reproduction of their genes. Because they need resources from their environment (in the broadest sense of the word), they will show behavior that is conducive to procuring or securing as many resources as possible. To accomplish this mission, people, being social animals, work together. The older parts of our brain (older in an evolutionary sense) make cooperation possible by means of emotion. The younger parts make it possible to formulate rules that reflect these emotions. In other words, these rules derive from factual, biological mechanisms. People experience these rules as “normative,” and as “ethical,” but even so, these rules are products of evolution. We, that is our brains, formulate them because they help our genes to spread. This, in a nutshell, is the biological theory of law as described in this book. Although philosophers of law and even sociobiologists are reluctant to concur that norms can be justified by biological mechanisms, this is what it takes to make a major step forward in the integration of biology, psychology, sociology, anthropology, and law. This book is a legalist’s implicit answer to the ideas of Charles Darwin, Richard Dawkins, Richard Alexander, James Q. Wilson, Daniel Dennet, Matt Ridley, Frans de Waal, and other sociobiologists. By introducing fractals and important aspects of law, it further enhances our insights in human behavior. Free riders by heart use law to improve their reproduction, and thus feel happy.
